Challenge

Load handling of special loads  
difficult to move

## Handling of heavy manufacturing tools

- The AGV is responsible for transporting the tools up to 20 Tn for manufacturing fuselage components from the warehouse to the autoclave, where they will undergo a curing process.

- The vehicle is capable of performing omnidirectional movements which allows it to reduce the space required for manoeuvring.

To ensure perfect handling of the load, this vehicle has a combination of three guidance systems: contour guidance, magnetic guidance and laser guidance.

Load handling of special loads  
difficult to move.
